Project Progress

Which tasks have been completed?

Have gotten docker up and running on my local system and working with a base python3 container. Have latest versions of numpy and python through docker script so they are automatically in the image.

Which tasks are pending?

Still need to figure out the exact dependency versions between python, numpy, and metapy to result in the least conflicts. Additionally, still need to create dockherhub account and publish image.

Are you facing any challenged?

The base image with just python3 is extremely large > 5gb so trying to find ways to shrink it.
